N. California Creeper

Date: June 22, 1924

Incb: fresh

Local: Tacoma Pierce Co. Wash.

Set Mark $3W\frac{4}{6}$

Nest: behind loose piece of bark on a 4" dead oak tree. Nest material showed below bark. Lower nest of coarse sticks and bark shreds. Upper part of moss - cup or pocket lined with feathers. Whole nest plastered to trunk. Eggs well protected in pocket. Entrance to the nest from above thru a crack in the bark. Bird flushed on hitting tree, then came very close and stayed about. Nest 10' up.

Coll by: Alden B. Miller for J.B.

④

N. ~~Shrike~~ Junco

Date: June 22, 1924

Incb: advanced

Local: Tacoma Pierce Co. Wash.

Set Mark: $4W\frac{4}{4}$

Nest: Of sticks and grass in a tin can in an old dump. Bird had filled can and then built nest near front.

③

H. Californicus

Date: June 22, 1954

Incub: fresh

Local: Tanager House Co. Block.

Set Mark: 200 ft

Nest: behind above fence

of hole in 4" thick

board over. Nest material

stems below hole.

Some nest of same size

and fresh eggs. Upper

part of nest - 2 eggs

fresh. Nest with 1 egg

which was hatched.

Incub. Eggs well hatched

in fresh material.

The nest from above

has a hole in the

side. Bird hatched on

June 22, 1954.

Incub. Eggs well hatched

in fresh material.

Col. by: [illegible]

H. Californicus

Date: June 23, 1954

Incub: [illegible]

Local: Tanager House Co. Block.

Set Mark: 200 ft

Nest: Of [illegible] and [illegible]

in [illegible] and [illegible]

and [illegible] and [illegible]

and [illegible] and [illegible]

and [illegible] and [illegible]

Nest lined with fine grass
and hair. Bird's nest
in this dump every year
in some old rusty can (V.H.B.)
Coll. by: Alden H. Miller per J.B.

(5)

N. Shufeldt's Junco
Date: June 28, 1924
Incub: fresh
Local: Tacoma, Pierce Co. Wash.
Set Mark 5W $\frac{14}{3}$

Nest: On the ground in
the woods. Nest flush with
the ground and placed
under a small spray
of dead fir which
completely covered the
nest. Surrounding ground
moss-covered. Nest proper
of grass, well cupped
and built into the sod.
Bird flushed within a
few feet.

Coll. by: Alden H. Miller per J.B.

(6)

N. Traill Flycatcher
Date: July 8, 1924
Incub: Slight
Local: Camp Lewis, Washington
Set Mark: 6W $\frac{14}{3}$

Nest: In the fir woods

(7)

That bird with fine green
and blue. Bird with
in this group
in a new old bird (blue)
Coll. by: John R. Miller Aug 1924

M. Shufeldt
Date: June 28, 1924
Loc: 1
Set Mark: 2 W/2

Notes: On the ground in
the woods. Nest built with
the ground and some
leaves. A small amount
of straw for the sides.
Completed. Covered the
nest. Surrounding ground
was - covered. The shape
of eggs were small
and light into the nest.
Bird hatched within a
few days.
Coll. by: John R. Miller Aug 1924

(8)

M. Trank's description
Date: July 8, 1924
Loc: 1
Set Mark: 2 W/2

Notes: In the ground

among a growth of low willows. Nest in a wild raspberry vine $3\frac{1}{2}$ feet up. Nest in plain sight, made of willow bark, some grass and a few feathers. Not a decorated nest as many here are. Bird always off nest but close by.

Coll. by Aldrich & Miller per JMB.

⑦ H. Streaked Horned Lark

Date: July 5 1924

Incub: advanced

Local: Stanaway, Tacoma Pierce's Wash

Set Mark: W 7 $\frac{1}{4}$

Nest: A depression in the ground on the open prairie. Nest near a stone and among young scotch broom 6" high. Nest cup $2\frac{1}{2}$ deep. Nests of this time of year all seem to be in these broom patches. Gowls says that earlier this is not true. These broom patches appear at a distance as patches of green grass 6" tall. The bird flushed at our feet which is not usual. This may have been due to

①

the heavy wind which
caused all birds to
stick to cover

Coll. by: Alden H. Miller for JHB

⑧ N. Dwarf Savannah Sparrow

Date: July 5, 1924

Incb. Advanced

Local: Stanbury, Tacoma, Pierce Co. Wash

Set. Mark W 8 $\frac{3}{5}$

Nest: In the prairie in
a patch of dwarf scotch
broom. Nest on a sloping
knoll covered with broom,
built into ground in a
tuft of the plant. Nest
made of grass (dry)
well cupped and put
together like a quince's.
Bird flushed at about 7 ft.
and soon returned to
chirp and scold.

Coll. by: Alden H. Miller for JHB.

⑨ N. Cedar Waxwing

Date: July 6 1924

Incb: Fresh

Local: Tacoma Pierce Co. Wash.

Set. Mark: 9W $\frac{4}{5}$

Nest. In an alder bush near
the swamp. Willow association
dense growth. Nest 7 ft up

8

the leaves around which
 covered all birds to
 stick to cover
 Coll. by: William W. Miller
 N. Oregon
 Date: July 2, 1924
 Loc. Jackson
 local: Jackson, Oregon, Fair Co. 1.14
 Set. Mark W8 1/2

9

Nest: In the leaves in
 a patch of brush with
 leaves, thick and covering
 small ground in a
 patch of brush. That
 was of the leaves of
 willow and other plants
 together with grasses.
 Eggs: 4, incubated at about 17.
 and were returned to
 chief and hatch.
 Coll. by: William W. Miller
 N. Oregon
 Date: July 2, 1924
 Loc. Jackson
 local: Jackson, Oregon, Fair Co. 2.14
 Set. Mark W8 1/2
 Nest: In an alder bush near
 the stream. Willow and
 some grass. That 17 up

Bird sat tight until
within 2 ft then flew
to nearby bush. This
pair kept around and
showed considerable
solicitude. Nest lower than
1st. Made of sticks, straw
etc. well cupped but poorly
lined nest rather small.
Another nest and pair of
bird was located near
by in similar location
but no eggs were present
at this date.

Coll. by: Alden H. Miller J.W.B.

Noted that while on the
nest the bird held the
crest down so that it
was not at all apparent.

(10)

11. California Creeper

Date July 20 1927

Incub. Completed - added

Local. Spawning, Tacoma Wn

Set. Mark W 10 $\frac{1}{4}$

Nest. In a black oak
underneath a large piece of
heavy bark on back thick.
Nest protruded from the crack
only slightly. Looking in several
times found eggs but nothing
and water. No birds. (over)

This year set of April
or May. That set of April
by it had partly one
piece. Another good specimen
found with set 3475. Alpine
Chlorophyll

①

Camp Lewis Trip

1924

June 13 Left San Francisco at 7 P.M. Boat a regular palace and sailed with very little motion. As we left the harbor I noticed some sea birds which appeared to be guillimots. Very few gulls followed the boat which was going 22 knots an hour.

June 14 Awoke about six A.M. to see that were close to shore along the Santa Cruz coast. Passed through the Golden Gate about 8 and landed in San Francisco. Went with some other S.C. fellows over to the Berkeley Campus. While attempting to find the Vertebrate Museum and wandered about the Campus and noticed an interesting Avifauna. The birds seem to entirely of transition character. Some of the birds breeding birds were American Robin, Foxglove Thrush, Nuttall Sparrow, Olive-backed Thrush, Chickadee Titmouse, etc. It seemed unusually queer to hear the "White Robins".

chipping around among
the bushes. Spent the
afternoon in looking over the
Museum bird collection.
They certainly have a great
assortment of material.
However the makeup of
the skins are poor and do
not at all compare with
Dickie's collection. Returned
to San Francisco. The boat
started at 6: P.M. The H.F.
serve great meals and
the service and courtesy
of the officials, porters, etc.
is quite surprising.
June 15. Spent the day in
traveling. The ship went
further out to sea and the
weather fogged up so we
could see nothing of interest.
The sea was quite calm
and seemed no rougher
than south of S.F. Saw
some large dark birds, but
could not identify them.
They were larger than
Ophidastor and flew gracefully
on bowed wings. They were
at quite a distance. Saw
a great many porpoises.
The sun set at 5:30 P.M. and
the sky remained light till
9:30.

6

6

6

(3)
June 10 Early this morning
awoke to find the fog
now blowing. Later looked
out the porthole to see
that we had entered the
sound. The water was like
glass and the mist hung
over the water. The hills
came down to the water
well covered with spruce
and green "indians"
undergrowth. The sound
winds around and finally
leads to Seattle - a rather
dirty yet large and
picturesque port. The town
is built on the hills like
San Francisco. The forest
comes to the edge of the
town and is left partly
standing on the hills.

Left Seattle at eleven and
sailed up the sound some
40 miles to Tacoma. Tacoma
is a similar city but smaller.
The sound here looks like
a lake. As I walked up
towards the town I heard
the first birds of small
order. The Song Sparrow was
the first to greet me.
We immediately left
(over)

(4)

for camp Lewis. The road was well paved and wandered thru the rolling spruce covered hills. The general farms appeared like the floor of a lake or of a marsh, but of course had no high mountains close surrounding. The camp itself is in quite wild country although it is really a city. Many other units are encamped here. The R. A. T. C. Camp is in a large meadow among the woods. I was assigned to the front porch on the west side of the meadow. After attending to camp duties, I strolled after supper to enjoy the long northern twilight. The meadow larks and juncos were singing in the meadow and around the barrock. In the log pergola of the headquarters building was a bluebird's nest - I suppose western. The light was not strong enough to distinguish the birds absolutely but I heard a great

(5)

beal. There were many
birds and a fair number
of species - latter contrary to
the report of Davis and Grinnell.
As I walked toward the west
I heard what I took to be
chipping sparrows and
finally saw one close by. The
eggs of some bird among the
meadows which I did
not know - all I could
see of it was that it was
some thing the size of
a fly. The song resembled
something of the *Vesper Sparrow*.
Soon I climbed up the wooded
hill thru a jungle of green
undergrowth & an Oak maple
and several juniper
shrubs. The pine trees were
very singular and tall.
Among them I heard an
Empidonax and an Olive-
sided - Several Crows passed
over and then the "black-
backed" Thrushes began to
sing. I was surprised to hear
a Jay near the edge of the
wood. A Grouse booming. I
could not see him but he
sounded like the Spruce -
however it was probably a
Dusky. Also heard a Horned

1. The first part of the paper is devoted to a discussion of the

general principles of the theory of the

the

the

the

the

(6)

Arrived from a patch of
brush. It was growing dark
and I could not see well so was
not sure of the bird. However
I pursued around some and
then left. I shall return as
soon as possible. Among other
things I heard a Crown Sparrow
which I believe was
Gambeli. The song was typical
of our winter birds in N. A. and
very much unlike the breeding
note of the Sierra. Also
heard Killdeer, some warblers, purple
finches, Sierran Vireo, Green Sallows.
Thus with some twenty species
in sight within two or three
hours as full as two things
be interesting. Later the Pacific
night hawk came out and
began booming.

June 14. Went with camp
Houten, took physical exam.

Am resting and got back
to barracks by noon. The rain then
came on and so the late
afternoon and evening will
probably be uneventful.

The first part of the paper
deals with the general
principles of the
subject. It is a
very important part
of the paper and
should be read
carefully. The
second part of the
paper deals with the
application of the
principles to the
case. It is a very
important part of
the paper and
should be read
carefully. The
third part of the
paper deals with the
conclusion. It is a
very important part
of the paper and
should be read
carefully.

(June 18th)

Went thru the regular routine of work but got some time off to go thru the woods. Went into wider country today. It is all a regular fly-buffet. Brake ferns, Dogwood, Thimbleberries, Blackberries and wild strawberries. Saw and heard several birds. First I heard the chickadee, which sounds rather different here - more like a *chickadee* with *chuck* - *ch-dee*.

Next a Trail Flycatcher with typical note. Near the water tanks saw a Bewick Wren which sang much after the fashion of the Sandwich Wren. Later caught out a pair of Pigeons. They clapped their wings. My pigeon did not look right. They were deep light color but both alike and rather thick. I actually heard the call of a Quail of the

Valley-California type
although Monday I
flushed a bird that
by sound and sight
appeared to be a
possibly to be all here
together. I heard a
repetition. Flycatcher in
usual brush fir timber
in a little clump north
East of the barcamp. Noted
a woodpecker of the
canyon type probably but
could make no positive
identification as they were
moving rapidly along.

Spurred Towhee - I suppose
these spurred and scrubby
Vireo but we also noted
the warblers I encountered
Monday I believe at Saline.
The perches are the only one
I have yet been able to see.
Heard first Golden B. Kinglet
in the high pine tops singing
with the typical repetition.
Yes rather
surprised to note Bush-tit
and large flock of winter
Wren. There is a possibility
of this too, some of the
familiarity of the
the birds here etc

Big Swallows around
the brooks and trees
Swallows, flying about and
Western Gophers can
be heard singing in the
woods.

June 17 I have been interested
in watching the great
birds here. They have a
 queer habit of playing
around the bodies like
pinnets. Sometimes I
see them around the
eyes and think - there
are some bugs, but
the turn out to be birds.
The males sing from
telephone poles, trees,
ground and rocks. They
fly very tame and I can
easily see that they are
much like the birds of
Southern California. Their
tail looks almost black.
As they come over me it
dawns I started one pair
while in a scurrying line
that I am sure had a
nest. I started others
before but could not come
flush them. I have seen
several pairs of many
birds are still nesting and

as soon as I can spend
some, intensive, hunting.
I think I'll find something.
I plan to look up Jack
Baker at and he may
be able to get me into
something. Yesterday we
viewed a sharp battle by
reapers, which was most
effective, whether
effective and, doubtless.
Missed the best of the
game but will receive
it soon. The 5th group
in the 4th, 5th, 6th line.
We may go on tomorrow.
I have not yet identified
this as a bird that sings
in the meadows. The
birds are very plain colored
with no distinguishing
marks. I shall be able to
spot some other species, or
the first lot what they are
from Bowles. My friend said
they were there when I returned.
I have seen Rainier
the first time (at least I saw
it really clearly). It seems
enormous, much more
the low country and reaching
the clouds the top can

up to out in the woods
today on a recruiting
party. I saw three Turkey
Vultures. Later on while
making my way leading a
patrol I flushed a Horned
Lark and a Thrush. I
stopped and went down to
see their nests. I had
to pass Mr. White.
Afternoon I returned and
found a large number of
the nests. The birds were
at a long distance and
so I went off to let
her come back. She did
not return so I apparently
checked the ground and
finally found it. It is only
a depression - near a higher
wood, made of dead grass
like surrounding ground. But
green grass - very fresh.
Anyway, I left them. The
birds flushed on running
both times. However the pair
the nest away by crawling
and creeping about 2 ft
from me. I had found a
Rufous-backed Thrush in a
nest - but it was empty.
The set late this evening.

~~Don't fail to buy otherwise~~

(7)

was fairly busy otherwise
since we had inspection.
We are getting well into
the camp routine. It is
not particularly objectionable
and sometimes interesting.
When I can hunt birds
with a while on duty for
not objecting. My first
impression of significance
of individuals and
species of birds remains.
Birds are common. I should
like to have more time
to study each everything
well. The trees are growing
of them different. All I
can do is run away
when I can and get
out out and around.
I wish to see more of
the birds. I have seen at the
time. I hope they are
gone at this. I will be
happy to see them. I got one
travel log today.

21

Spent the morning cleaning
the one powder and stokes
mortar. Got up at noon
dressed "Kivory" and went
into Laona with one of

the fellows who brought
 up his machine. Located
 Thick Bowler apt but he
 was not at home. I spent
 a large part of the afternoon
 and evening in a park
 near by where I could
 conveniently visit the
 "Woodstock" apt. which in
 the park I located the
 nest of a Great-back Thrush
 with fresh eggs. I was
 pleased for the first time
 Cedar Waxwings and
 Yellow Warblers. Spent the
 night in a hotel. In
 the evening the night Hawks
 were flying everywhere over
 the city. They seemed to
 be mating. I have no
 doubt about what countless
 pairs of them nest on
 the flat top of the building
 as they sit on Jack Pines
 of apartment house. Also
 noted several martins,
 which I suppose are nesting,
 flying about the eaves
 in the center of town.

22

got up & going in
 order to catch Jack Bowler

before he left for the day.
I found him at home at
8:30. He was very cordial
and took me into his
rooms. They are some place
the ideal workshop with a
constant odor of incense. So so
much to find he had
just been on a month
trip into the mountains and
was rather exhausted
at home. He was not sure of
a party for the day with
a private workshop, etc.
Kitchen, out into the
woods.

We started about nine
and started on the car line
for the country. After a
half hour still we came
to the top and only saw
around because they
set forth. The weather was
clear and everything fine.
As we passed the bridge
we noticed many swallows,
Redpolls and Woodpeckers,
both young and old. The
birds were exceedingly
tame as we approached
within fifty feet. The city
is growing, the swamp
and Bowls hope for a

second Lake Merritt. The birds are common here and have good shelter so I see no reason why something good can not be made of the place. The hunter the bird along the edge. First thing off the bat I discovered a great stick in the top of the forest with a Cedar growing sitting upon it! — Right high — I was mighty glad to find it as I have always wanted to see these birds at home and to see their nest and eggs. The nest contained 6 or 7 eggs. — (for further description see later). The birds with suspiciously never showed up after the first few days, flushed. When they would be so tongue-tied, feeding and so well shown. The nest, I don't know. They simply act as if they didn't care what happened around the nest. A little later sitting found a nice set of 4 perfect eggs which I collected being my

(8)

The first part of the paper
describes the general situation
of the country and the
state of the economy. It
then goes on to discuss the
social and cultural conditions
of the country. The paper
concludes with a summary
of the findings and a
recommendation for further
research.

first personally collected.
 but we found several
~~sets~~ nests of some of the
 Warbler and two of the
 newly nest building.
 Bowles was looking for
 Yellow Goldfinches, ~~but~~
~~then~~ a couple later found
 another set of fresh
 eggs. ~~so~~ ~~to~~ ~~what~~
~~for~~ ~~this~~ ~~year~~. This
 set was fresh and
 showed the sunblaze &
 7 damaged eggs. The nest
 was in a wild cherry
 bush 12 feet in place
 sight. The bird could
 be seen sitting. The
 nest seems to be fairly
 deep and well constructed.
 The full sparrows are
 also nesting for eggs
 Jack Bowles. We left the
 swamp and went back
 into the woods where
 new birds were being
 collected. Creeper, Hermit Warbler
 Cassin's Lark etc. I have
 made up a list of birds
 observed in Wash. so far
 which I shall include
 today. Some names are not
 complete, although I learned
 much from Bowles about what
 they were.

Bird List
Camp Lewis - Tacoma Vicinity
June 10 -

x Cormorant,
Gull,
Plover

x Quail, Calif.

x Grouse, Sooty

x Pacific Nighthawk

+ Flycatcher, Olive-sided

x Flycatcher, Hammond

x Horned Lark, Streaked

x Crow, Western

Purple Finch, California

Pine Siskin

Goldfinch, green-backed

x Sparrow, Oregon Vesper Sparrow

x Sparrow, English

x Chipping Sparrow, Western

x Titmouse, White-throated

x Violet Green Swallow, Northern

x Titmouse, Olive

x Thrush, Hermit - backed

Western Robin

22

Bluebird, Western

Meadowlark, Western

Pigeon, Rock - tailed

Quail, Plumbeous

+ Woodpecker, Gairdner

Small Flycatcher

Western Flycatcher

Junco, Spurred

Western Lark

Hermit

54+ Bush-tit, Coast
Pied-b. Kinglet

55+ Canada Warbler
Willow Goldfinch

+ Kinglet
Song Sparrow, ~~Downy~~
Pied Swallow

56-57 Yellow Warbler
Red-breasted Nuthatch

~~English Sparrow~~
T. W. Vulture

58 Evening Grosbeak (heard only)
Yellow Warbler
Barn Swallow

+ Jay, "Blue-fronted"
Rufous Creeper
Cooper Hawk
Wood Pewee

Magpie
Ruddy Duck
Brewer Blackbird

N.W. Red-winged Blackbird
Cassin Vireo

59 Nuttall Sparrow

56 Rhyacionia

57 Pacific Yellowthroat

The hunting in the woods is fairly good. We located a *Hirundo* + *Thatcher* with which we were impossible without rope and also found several birds of *Tolmie*. *Grouse* were heard from but not seen.

King-necked *Therion*. Finally bowls located a *Therion* nest built in a small dead oak under a piece of bark about ready to drop off. The nest was big and built well down into the rock. The bottom of the showed plainly. The nest with *Therion* eggs was collected. The nest is a beauty - well shaped and built with ribs. For *Therion* there are two or three large red *Therion* feathers crisscrossed into the *Therion* making the nest very spectacular. Also found a *Therion*'s nest with *Therion* eggs. This is shaped like *Therion*. The nest was placed under a

1. 1/2

C

C

C

the can. Bowles has
 collected a set from this
 pair in the pen can
 for several years.
 Bowles seems to have
 things pretty well planned
 out. He knows every pair
 of birds in this upland.
 First three new species
 I felt well satisfied and
 so we returned about
 4:30. I found that my
 unknown Sparrow was
 the Oregon vesper sparrow.
 It's song is quite different
 from that of western
 vesper. Altho I now
 know the relation I can
 see the similarity. The
 birds were very common
 here and altho the season
 is advanced I expect to
 find several things. I
 sent the nests off by
 parcel post and will have
 to manage the eggs
 in camp. Bowles treated
 me fine and seems
 sure to be a nice
 fellow. I shall come in
 next week and if possible.
 I did not collect the Kingbirds.
 They are the same as home

and so unless the
 prove to be exceptional
 I shall not take them.
 The furred furs ought to
 be ready ~~too~~ soon.

June 23

Had charge of quarters
 today and had to stay
 in. The job is not hard
 but I have to stay in
 barracks all day. I
 therefore have a chance
 to write some delayed
 notes and letters. I
 found out from Bowles
 that ~~cat~~ shooting is
 not allowed in Thomas
 City Game reserve and
 I don't know about camp
 area. The Game Reserve
 covers nearly all the
 nearby country. Therefore
 I'm afraid I won't do
 much collecting of skins.
 I may want to stay
 only a few days after
 camp to engage to see
 a little of the country.
 Egg season will of course
 be over then. The camp
 is over the 23rd and my boat
 sails the 29th. This will give
 me, probably sufficient time

[Faint, illegible handwriting on lined paper, possibly bleed-through from the reverse side. The text is too light to transcribe accurately.]

June 24

Went thru with regular drill schedule. Weather seems to never be able to clear. It doesn't rain but clouds up and clears off and on. This week we are shooting on the range.

In the afternoon went and looked over the Bluebirds nest and found the egg hatched. It was a high set but was too hard set to make any with. Also went to the dove's back nest which was destroyed. I don't know what could have happened - all was gone and nest replaced.

Later went thru woods and scared up a flock of young quail and hen. Two young birds the size of a quail rail flew up above the tall grass. Two more flushed and began looking for the hen but could not see her. I started the chick call and up she

hopped 10' in front of me. She came straight toward strutting and clucking with tail spread. She advanced to six feet. I could see the bare patches on the side of her neck. The bird seemed very small and rufous brown on the back as so might have been an Oregon Ruffed Grouse. I supposed though that they were Dusky grouse. After I had stared up & loomed she flew to a pine nearly straight up. Then she began to flick much like the female grouse heard in June.

I could not approach her more from the tree by voice so I threw rocks to make her flush. I hit the bird at her feet, the bird popped her head and waggled her tail but she wouldn't move. If I had happened to hit her head I think I would have had a grouse. Finally she flew high up in the top of the spruce.

Spent the evening at the
club room playing cards.

June
25

Went to the range
this morning. Didn't
have a chance to fire
myself. Got afternoon off so
for pepper and went out
into the woods to blow
eggs. Managed very well.
Found a place for a
wild patch of timber and
undergrowth and built
a rack of bark and
rotten logs. I have a cup
with my carton (eggs)
that I keep for beer!
With a little saving
I buy all 19 eggs with
a pint and a cup of water.
The Waxwings were fairly
well incubated but some
more than others. The
Juncos were also fairly
well incub. but the Thrush
and Cuckoo were as
fresh as butter. Spent
the whole afternoon
in my "outdoor laboratory"
and got back just in
time for a good supper.

~~June 26~~ Spent the day on the range in the usual target practice. We are becoming fairly accurate with our fire but also are able to set the grass burning at least once a day. Am not able to do much in the afternoon since there are many things to clean and washing to do.

~~June 27~~ Same routine on the target range except for the taking up of the shooting of the October month. Had a pretty fair entertainment at the club in the evening.

~~June 28~~ Served my first A.O. Only coffee which of course had to fall on a Saturday. However the work is not bad. I don't want to make excuses I have to however.

~~29~~ Out of the camp went to Green River gorge near Mt Rainier but

Since they were going
 to stay there only 12
 hours I did not go.
 Jack Bowler says it is
 nothing more than any
 of our California Camps.
 I left early for town
 and arrived at Bowler's
 at 8.30 a.m. We went
 out into the woods near
 Stanaway Lake. The country
 is much alike, yet it
 is all beautiful. It seems
 like everything is new.
 In all the jack-pays
 in the town instead of
 being covered with clay
 weeds they are full of
 stumps and overgrown
 with black fern. The
 more I see of this country
 the more it seems like
 high mountains, flattened
 out.

Things are getting rather
 well advanced in the
 egg line. I saw one of
 Jack a nice set of 5
 Sharp-shinned Hawks - a rather
 different type from the
 previous set. The nest was
 a "beaut" and I was able
 to save it well. There

1

were many birds about:-
Hermit Warblers, Audubon
Warblers, Kinglets, and
Colonial Warblers were all
singing. The Warblers were
probably all there but
the Kinglets might have
been nesting. The
Western Flycatchers
are as thick as
flies about the
woods but we could
locate no nests. I
never have seen the
birds more common.
Heard Lark Bunting for
the first time. We passed
the winter Wren Country
but saw no birds;
found several Creeper
nests partly built; however
they probably will never
be completed.

At two o'clock we
went into town to look
over Bowler's Collection. Seems
to me his collection is
about ideal. One of the best
representations of species -
well displayed - photographs
or nests paper with
75% of the nests -
everything well labelled -

all sets and nests
 choice and showing
 widest range of variation
 within a few sets.
 Also he has many
 unusual sets and nests.

The utmost care in
 selection of sets has taken
 the place to a certain
 extent the value of a
 series and placed the
 range of variation in
 easily noticeable form.

Throughout the arrangement
 is good and artistic.

The only other collection
 of comparable bird sets
~~known~~ and that I have
 seen is Dawson's which
 is of course a Museum
 collection made up
 from the collections of
 many people. However

Dawson's collection is not
 nearly as easy of access
 and does not show in
 concentrated form the things
 that Bowles shows. Bowles'
 collection is in many
 ways more instructive
 and valuable for N. Am.
 birds than is Dawson.
 Whenever you wish to see

A serious error - Dawson
is the only one can
show it to you and
he must explain
everything since it is
poorly labelled.

Returned to camp in
time for supper then
washed clothes all
evening.

The weather has been
clear and fine for the
past few days and
mountain tops (Cairns)
stood out plainly but
the weather turned hot
and sunny today.

Getting ready for the
4th of July.

Today when I got
some small change on
the streets I got about
four Canadian times I
find that they are used
rather freely here and
no one seems to care.

30 Weather is still
hot and the grass
in the open places
is turning dry. The
woods are as green as
ever. Again we fired on

the 37 ym range -
making fair targets.

July 1 Still hot. I don't believe the temperature is at all high but the air seems damp. Also it seems hot in contrast with the previous cold weather. Slept with pajamas sheet and Army blanket even now. Made a "possible" on the range today. 15 hits out of 15 fired. Saw several rabbits on the way to target range.

I have noted Gray Squirrels, Possums, Skunk and chipmunk in the mountain line.

I learned Sunday that the grouse I saw with the young was an Oregon Ruffed Grouse. He says that the ruffs on the back was typical of Ruffed Grouse. Also the ruffs about the neck were characteristic.

The Sooty grouse would not have come at me in the way this bird did.

[The page contains extremely faint, illegible handwriting on lined paper. The text is too light to transcribe accurately.]

I forgot to mention that
Sunday we found the
old nest of a Sooty
Grouse that Bowles had
first found. The egg
shells were present. Nest
was situated under
a mass of brush and
chicken wire in the
woods. The nest proper
only a shallow hollow
in the moss of the ground.

Wed July 2

Went over to
American Lake for my
first swim. The water
feels warm and the
swimming great. By
evening I came back
from the woods seeing
up a maynard from
a log on the fire, were
abundant and about
the same as ever
before. Saw several evening
throats as well as
several crepuscular
finches. There were
loads of snail's nest
with three eggs incubated
started the second egg
nest full of young of the day
about to leave the nest.

July 3 ~~at all of these~~
~~the birds today~~ ~~to be~~
the weekend. Picked
up the set of snail
as I left. I arrived
in town about 10
but found they were out.
However since I had
given me a key I

grade myself it
home.

July 4 - started out and
went out to see
to look for
a better place
than the one we had.
Saw many birds
at a fine site heavily
forested. Returned by
the "road" and along
the way we saw
the birds.

In the evening we
looked over the
Keweenaw. The
place is very
beautiful. It is
not comparable
with the
independence with
the other side of
the water. It is
on the coast.

July 5 - Went out to the
morning. The
place is better with
the birds. It is
not so good as
the other. Nevertheless
decided to go.

The above description of
oak forest, especially
ground cover, the birds
in your covered with
short grass except
for patches of
moss. After waiting
for 15 minutes we
found a set of eggs
dark in the of washed
moss, all total 3
seems that the
nest is on the
rather than the possible
bird. We found several
other empty nests.

While walking down
an old road, I
noticed a bird took
at 15 ft on the
ground near the road.
The nest was there,
but could not be told
but at first within a
couple of feet of where

first I thought was an
obviously different follow
with a feather near
by. So I said the
bird was not so I
shally return.

There were a great
many birds in the

about. Many males
lingering and hovering
over the nest also several
~~other~~ birds with their
light colored plumage. A little
afternoon's haffing
to the nest as a different
both of the species, Brown
(or tall) and flushed a
small Dwarf Scaup
flapping its wings. These
are species of the nest, but
belonging to the same
nest. About the nest just
before dark. No other was
seen. Found one and
he was very young. It
that Brook took at Vancouver.
There are the only eggs
known to have up. The bird
could not see and it
was very young and
very soft. The bird
found it on Vancouver
7-10-4. Also the eggs
were yellowish in
coloration and could
be seen through a microscope.
The other was a small
set of eggs and also
the "Bridges" the carry
note is the same. ~~Some~~
Some of the birds

not hear the song of
nor did we see any other
of the species. The song
travels in a very rapid
series of the bird at
that distance of descent
from the trees. The song
is brought with a rapidly
performed the repeated
notes.

noticed that there are
two species of woodpecker
here. One is with the
red back, the other is with
the chestnut back. I did
a few species of the
California birds. The other
that I saw is more like
the eastern bird and
here, in habits, the woodpecker
association, whereas the
other woodpecker stays with
the wood.

Today I concluded
a trade with the kitchen
on which I am getting
a lot of work. The
I can't get myself
back of course and
I have to
the street is for
with him.
Have been talking

of the East side and
highway from West
the state with paper
country it would be
just to get over the
but without a sign
and would not ensure
it is not available to
try. The state has a
a mixture of coast
ground and Eastern land.
The East side would
therefore be the most
important. For example
the people of the
had thought was poor
and brown is the
western side. The
people of the
in the area and the
it is the

transportation here is
not what it is in Calif.
If a trip would be required
to see all the country
it is a very long trip
not very profitable
since one can not reach
the high country except
in two days paid trip.
However one can not
hope to see a whole state
in a little over a month

with only two days
between each week.

July 1st went out with Mr.
Hitchin to the river
(the river was in the flood)
and found several
trails with all the
logs or buildings that
left them all. Found
another all of a
piece of a bridge. Then
went out with forward
great water. Then
saw a short bridge
showing more like a
than the previous one
saw. The bridge was
very together and with
very little about the
rest. There was another
piece, showing close by.
Saw a light in a small
"lick" out of a hole.
There was a lot.

Then all came successfully
and returned to camp.

July 2nd a very orderly
then so far to the
quarters - and
write letters.

There are now many
barrachos about the
gorge. I saw the
young ones. I think that
the deeper, perhaps they
only come in the morning
or late in the evening.
The song is certainly
different from the typical
flock. Although the
singing is like the same
sound, I think that they
never found this bird
with a nest like
the one found at
Thermonia.

See three days off
was a pleasant change.
And altho I did not
do a great deal I enjoyed
myself while staying
at the quarters.

While near the swamp
Sunday we saw a great
many ruddy Ducks. Altho
the first early year I believe
they are still nesting for
they act the same as the
males at Buena Vista.
Saw a Spotted Sandpiper along
the slough. The bird must

have had young. Again
I think of this country
as California, mountains
flattened out.

July 8. Acted as room
 orderly again.
 Today so didn't get
 out on vital range.
 They gave me order
 because I had to fire
 later anyway and no
 one could leave the
 range desk. The job
 is however easy.

Washed clothing, etc.
 and cleaned up for a
 coming inspection.

July 9. Went out for a
 while this evening
 into a new section
 of woods across the
 prairie - meadows the
 camp is in.

The woods were very
 much the same as
 other - possibly extra tall
 timber. There was a great
 abundance of huckleberries.
 The berries were large
 ripe and numerous and
 I ate until I had
 enough and left enough
 berries for a camp.

There were a great
 many noisy crows
 about but otherwise no
 birds.

While eating berries
I heard a great commotion
among the crows and
the cackle of a hawk.
The crows were evidently
nipping it. I kept still
and then gave a Cooper
Hawk whistle and later
a Douglas Squirrel note.
The old hawk came
straight for the sound
heading thru heavy
woods with a mob of
crows in attendance.

I was concealed
but the hawk caught
me by sound within
20 ft. The bird sat
there ~~the~~ the crows
made a terrible uproar.
I had not whistled
for a while when again
the bird flew to me
and it must have been
a long way off at
first so it lost me
very well by sound.
The bird was evidently
a female Cooper in full
brown ~~juv~~ plumage.
There was a Chipmunk
started backing away
after the hawk flew.

Also heard a grouse
booming in the same
woods.

Went out on a
prairie on the other
side. There were many
crows, blue jays, sparrows,
and horned larks.
The crows must have
young. The jays were
singing strong as dusk
came on.

Went back to the
prairie about camp
and watched the
night hawks. There were
literally dozens of birds
booming about. I walked
out on a bare rocky
spot and waved my
hat at the birds. First
one bird immediately
dove down at me and
I thought it would boom
but it merely swooped about
10 ft from me and made
no noise. The young
were held up at an
angle as usual when
flying. This position was
held ~~throughout~~ ^{throughout} the
plunge and turn.

Diagram

I warmed my hat again and the bird dove exactly as before but turned the wings down at the turn and the booming sound was produced.

This turning of the wing must cause the boom as the bird repeated the stunt close to me many times. The wings seem to be pulled ~~stretched~~ stretched on the plunge the only turned down and raised for the boom. Evidently the bird can readily check the dive with the tail and not boom. The boom apparently does not check the flight greatly as the bird seems to move on ~~very~~ at any even rate of speed. The boom is then purely made by the wings and simply for the effect; also it can be avoided. The greater the speed of the bird the louder

the sound. I saw
one boom on a ten or 15
foot plume but the sound
was weak. Other times the
plumes must have been
little short of 100 ft.
However while feeding
along the dive was usually
not 50 ft. The angle of the
feathers slanted to the right
10° with the ground. The
turn is always fairly smooth
and the accepted 70° measure
for 25 ft then more gradual.
The bill seen to usually
turn about 15° from the
ground altho it may
be more as when feeding
or possibly lower.
This bird I believe
was nesting here I shall
try to return by daylight
sometimes. Nevertheless
there was another bird
singing close about but
it showed once or twice
rather faintly. Apparently
the bird disappeared the
moment another was
and were flying the
last bird. But when
feeding along feeding
the go like a purpose

with 30 ft booming
dive all high up in air
coming down low.
Of course the birds
on the nesting split
off some but so a
lot of diving. After
dive they give a big
boom. I would say the
call note perceptible.

The boom itself at a
distance of 20 ft seems
weak while the negative
note is strong. But the
is a resonating vibration
in the boom that carries
farther. The boom has
resonance. The note is
sharp but shut in. Therefore
at a distance one hears only
booms and no notes.

I stood on the plain
from 7.30 to 8.30 with
my back to the bird. I was
watching the bird. Very
often I could hear
a reply continuous
booming.

I hope later to find
a nest and see for

sure how the birds
act, right at the nest.
I would like to hear
of the females are boom.
The birds I know
boom a great deal around
and over Boulder, rock
where they will probably
nest as they have ^{years} before.

July 9 / Went out today to
help on the pistol
range, altho I don't
fire until tomorrow.
We are automatic Colts
I shot in a magazine
the fire pretty well.
You can see them.
The trouble is, we
have only one day practice
before we ever fire.
Then, one day to qualify.

July 10 / I had preliminary
pistol today and
caught on fairly well.
I will probably
get. Masterman qualification.
I wish we had more
time to get a little more
used to the gun.
Filling the trap with
steady pressure is half

the game and it takes
a while to permit.

July 11 Made my marksmanship
today at West as per
as my calculations as
to the officials don't
forget the records I'll
keep it for my badge.

I did poor on slow
fire but better on rapid
fire and quick fire.
I guess I have to ~~do~~
do it fast or not at all.

I am going on the Rammer
trip tomorrow at 8.00.
A three day trip to the
Rammer country. I don't
know how much I'll
be able to see, however
ammy transport and in
a military camp but
I'm looking a pretty
good chance. Of course
we will only go to the
base of the mountain
and then part of the
National Park.

H₂Co ROTE.
Camp Lewis

July 11

Dear Dad,

Altho I sent
my notes only a few
days ago I want to
get rid of these as I
can't send them later
all in one letter.

I thought the Nighthawk
observations might be of
special interest.

Please save them
and forward as usual.

I am looking forward
to the Rainier trip with
great expectations

With lots of love
Alden

July
12/

Left Camp Lewis
at 7 o'clock in
the morning on an
army convoy bound
for Mt. Rainier Park.
There was a great string
of trucks which was
constantly stopping. The
trip was short and
we did not arrive
in the park until
2 P.M.

Nevertheless, all
disagreeable features of
the first part of our
trip were dispensed
with.

The 75 miles from
Lewis to the park was
almost a continuous
forest. First the country
was level then we
crossed several large
river valleys and
smaller basins to reach
the foothills, altho
they looked no more
like foothills in C.O.
than the country
around Lake Tahoe.
The weather was very
smoky due to the

many forest fires.
But we could see that
the timber was getting
heavier and the mountains
higher. I missed the
~~high~~ rugged peaks. All
the mountains at least
those that are wooded
are rounded off.
We finally camped
at Longacre Meadow
in the valley below
the great glacier and
Paradise Valley. — Elev. 2700.
This was high up in the
mountains. Here I saw
Lincoln Sparrow a bird
usually of Canadian
zone — 7500 ft in the Sierras.
Another queer thing
however was the Song
Sparrows singing along
side the Lincolns.
Several of us started
after a late lunch at
6 P.M. for the Paradise
Glacier (8 mi). I suppose
I could not shake the
crowd but saw as
much as I could.
The trees here are also
of high zone. I could
not picture that are

2003-2004
The following is a list of the names of the students who were in the class of 2003-2004.

1. John Doe

were only at 3000 ft
when timber line was
near and we were at
the glacier.

The forest was largely
hemlock which I don't
recall seeing in any
different species. The leaves
are different. The cones
smaller and the growth
of the tree different.
The tops do not spread
over the mountain. Hemlock
yet the tree is slender
and somewhat singular
in form. Among the
hemlocks are a few
Douglas fir, white fir
Cedar (not Quince), and
a few mountain pine!
The flower of the forest
is solid green which
runs up the trunk
and makes everything
green. On a spot I
saw a few evergreen ferns.
The trees are close
together of various size
and have with great
masses of moss. There
are no yellow pine and
no white pine.
The trail to the glacier

travel thru dense
 woods occasionally
 clearing out to the
 river which is gray
 with gray silt from the
 glacier. All the rivers
 seem to be the same.
 Only small brooks are
 clear. While travelling
 thru the woods I heard
 for the first time the
 peculiar song of the
 barred thrush and
 saw several of the
 birds. The song was of
 course the hurried
 whistle given every
 but at fairly frequent
 intervals. At a distance
 especially it has a very
 thrush-like quality
 but it is a weird note
 and hard to place. If
 the birds I saw then
 appeared very much
 like robins but were
 much more quiet
 and shy.

We went next to
 the foot of the glacier
 and back of pieces
 of ice. The foot of the
 glacier rose some 50 ft

straight up the
 slanted back and up.
 at 200 ft deep farther back
 for all I should know.
 Of course, at a distance,
 the whole thing looks
 like a mud dump
 because of the dirt
 covering where were
 many boulders perched
 on top and a fine
 moraine along the
 side. The river comes
 rushing out from under
 the ice.

We returned in a
 hurry to camp to get
 in on the end of the
 "Chow" line. While on
 the line I heard a
 warbler of some sort
 that had been singing.
 I could not find the
 bird and it sure had
 me worried. I would
 like to have more time
 to hunt it down.

The mountain, shared
 by evergreens and me,
 gave the full beauty
 of Kaministiquia for

the valley walls
of the steep wooded
valley. The mountain
was only about 25 miles
away.

The moon came
out alone with a
few supernovas and
the mountain glowed
bright in the white light.
A heavy haze of
better effect with the
silver light on the
forests - the mountain
and the meadow
with the brook.

We turned in early
since we were so
ripe and go hiking
at 3.30 AM. We left
suddenly on a steep
mountain except for
one interruption of a
tame elk which wandered
around the camp and
ramped on the tent
rope.

July
13/

Morning came with
a breeze and the weather
was cold and clear.
The mountain was quiet.
No one trying to tell
about - at least I can't

do it successfully.
 While starting to eat
 my breakfast I dropped
 the butter off of my plate.
 Suddenly an American
 Jay jumped down and
 proceeded to eat it.
 I soon looked him
 over. They are a grey then
 and then altho they have
 a weak back and no
 blue. The flight feathers
 are and the tail feathers
 seem sort of split
 split in two. The bird
 was in poor plumage
 but nevertheless interesting.
 Soon several birds came
 around and I had
 quite a time feeding
 them. They were fairly
 quiet but very bold.
 The note sounds very
 merric like. More like
 merric than joy. But
 they have a loud clear
 whistle which was
 the only other note I heard.
 This whistle was like
 certain Poyas I heard
 notes yet distinctive.
 I heard one start of
 on a clear whistled

⑧

some in clear voice
with quantity of they
whistle. Hypochoeris
was very common.
like that of the blue-fronted
jays.

The trail climbed
thru the woods crossing
the river. We were helped
for Paradise valley elev.
5500 ft. We passed several
celebrated falls which
were pretty but rather
insignificant compared
with Aspenite. Soon
we came to the meadow
country near timberline
and arrived at Paradise
In 5 1/2 miles from
camp at 9 a.m.

I made an effort to
ditch the crowd and
succeeded. I tramped
around thru the meadows
and the heather covered
hill side. Many birds
were present for part the
birds were very abundant
about. Hawks, Siskins,
some Fox Sparrow, Purple
finch, Robin, Chelonia
and best of all Kingbird

1

0.5%

[Faint, illegible handwriting on lined paper]

Leucosticte. Certainly
 this is Alpine zone.
 From here up
 stretched the snow fields
 and glaciers. Along
 with the other birds
 were Robins, Varied Thrushes
 Hermit Thrushes and
 Solitaires.

While walking by
 a snow bank I heard
 the familiar Leucosticte
~~about~~ twitter and soon
 saw several birds drop
 down on a bank just
 ahead. The birds were
 extremely tame and
 walked to within 15 ft
 of me. They were about
 the size of English Sparrows.
 I could see their eyes
 and with my glass could
 see every feather. As I
 looked over the bank
 I saw another bird
 hopping about and
 thought at first it was
 another Leucosticte
 but it turned out to be
 a Fox Sparrow. The Sparrow
 came close and it
 seemed to have a very
 gray head and light

bird. I will look up
 the subspecies later.
 I sat for nearly an
 hour watching the Larks.
 They were on the snow
 like blackbirds - not
 hopping. There were
 some full grown and
 bright well plumaged
 adults. Some of the young
 were beginning for food.
 They were for the most part
 downy feathers with the
 white around the base
 of the bill. While watching
 one young bird at
 15 ft with the glass I
 saw it pick up some-
 thing, evidently the common
 food, then it would drop
 it. ~~The point of~~ I could
 see the point on the snow
 and so heard the
 bird away and found
 the object to be a seed
 from the hemlock. The
 snow lay was toward
 of some trees and the
 banks were covered
 with seed. I could see
 no insects on the snow
 and I think they were
 feeding on seeds primarily.

As singing parties last
by the fire would fly
into the trees and
peep. Then return where
they perched down.
The notes seem exactly
the same as the singing
birds. I again heard the
song delivered from a
tree top.

From ~~the~~ the Inn
I went up a couple
of miles onto the Paradise
Glacier and the mountain
proper. Few other birds
but Leuco's here.

Saw a big fat woodchuck
waddling over the snow.
He would walk a ways
thump flat on the
snow and roll around.
He was very large and
white-necked.

Also saw and heard
a Coyote. I was much
surprised to find they have
a very different and much
weaker bark. He goes thru
all the motions but doesn't
produce the results.

I thought when I first
heard it that it was
a family of young woodchucks.

I thought maybe this
~~bird~~ crow had a
 sore throat but others
 sang the same.

While up in the
 meadow I heard a
 very peculiar song -
 something like a rock
 wren and yet entirely
 different from anything
 I know. The song sort of
 bubbled along with not
 definite notes. The stream
 prevented me from
 hearing clearly ~~but~~ and
 I could not hear it
 again. Unfortunately
 I went down to the
 stream and there was
 a water ouzel chipping
 about. I believe it was
 this but ~~never~~ I
 could see no other birds
 near and so I believe
 it was the ouzel. It
 could well be. Certainly
 it was interesting and
 I would have liked to
 hear it again. I watched
 the ouzel ~~for some~~ for
 a long time but it
 would not sing nor
 did I hear the song
 elsewhere.

151

[Faint, illegible handwriting on lined paper]

I from the ridge ~~to~~
 where I hiked I could
 see Mt Adams and
 Kelowna 12,000 ft peaks.
 Opposite Rainier was
 a long ridge of snowy
 jagged peaks like those
 seen in the Sierras.
 The country is sure
 wonderful. Green meadows
 hemlock trees snowcap
 ridges - Rainier all at
 6000 ft. on an auto
 road. To say nothing
 of birds and flowers.
 I went over considerable
 marsh country and
 among the Pacific and
 red feathers & try to
 find a Otterman! But
 have none. I think
 great to see the spirit
 of bushy spirit. They
 seemed to stay very
 close to timberline.
 At 11:30 I left camp
 as we left by truck
 for Lewis at 2 P.M.
 Our return trip was
 necessarily hurried and
 we passed thru the
 same country. I can
 not tell ~~up~~ ~~all~~

The first part of the paper discusses the importance of maintaining accurate records of all transactions. It is essential for the business to have a clear and concise record of all income and expenses. This will allow the business to track its financial performance over time and identify areas for improvement.

The second part of the paper discusses the importance of maintaining accurate records of all assets and liabilities. This will allow the business to track its net worth over time and identify areas for improvement.

The third part of the paper discusses the importance of maintaining accurate records of all debts and obligations. This will allow the business to track its financial obligations over time and identify areas for improvement.

The fourth part of the paper discusses the importance of maintaining accurate records of all taxes and other legal obligations. This will allow the business to track its financial obligations over time and identify areas for improvement.

The fifth part of the paper discusses the importance of maintaining accurate records of all other financial information. This will allow the business to track its financial performance over time and identify areas for improvement.

In conclusion, maintaining accurate records of all financial information is essential for the success of any business. It will allow the business to track its financial performance over time and identify areas for improvement.

half of all the wonder
but surely it is worthy
of being a National
Park.

Our return trip was
long and dusty but
that may well be
forgotten.

Of the biologic life
there I can not quite
understand it. The zones
seem mixed. At the
high mountain tops
prevails some better
thing, deep in. I can
not really make any
statement of what is
there from any short
sightseeing trip.

All I know is I want
to go back and see
some more. I got an
awful kick out of what
I saw but it was
just a sort of appetizer.
The way out is better
than in.

June 4th kind of sleep
today as we picked
a total of 23 miles in
24 hours with 6 hours

sleep.

This week I am
top sergeant so am
rather busy. Spent the
day today in repair
work and writing notes.
The weather clouded
up today and we had
quite a rain.

Tue July 15

Had a field problem today with sham battle without bullets. I didn't go up on the line because of being hurt. About the middle of the morning the rains clamped the area and we retired to camp.

During the afternoon the rain continued and we were confined to quarters.

Wed. July 16

C. W. & I went out inspecting trench systems. Killed a lot of birds. We put in during the early morning building three pyramidal mounds. While walking thru the grass we scared up what I took to be a pheasant. We caught it and kept it for some time. It was a small one.

smaller than a pocket mouse and looked like a mole with ears already up. The fur was pale like and the short long and ~~was~~ constantly moving.

Later we scared up a small rabbit size of a cottontail but of brick red-brown color. I noticed no white in the tail.

In the afternoon went in town to look over the traps on the Spawning prairie.

I found the nightbirds gone and no bird could be flushed from the vicinity of the hollow or the place where the bird was flushed before.

Nothing came of the horned lark or thrush?
next.

I guess the season is about over.

The wind was blowing and the rain seemed still to be in the air.

17 We were scheduled today for a pipe starting in the morning and lasting 2 days. We were delayed by rain till noon. The pipe only lasted 20 minutes and then we made camp near American Lake.

My turn had come for guard so I stood guard in camp. Quite enough to merit a corporal and so walked no part.

It rained again in the night but not enough to go thru the pup tents.

Altho I was up several hours in the night, it was time I took any birds. Bowles takes Bunnings, Sereph Owl, Horned Owl, and Saw-whet.

18 The rest of the camp left this half-day with water in the night at our field camp and everywhere.

The guard stayed in
camp and returned
with the regiment at
7. P. M.

14 In Morning went over
to inspection of bird
specimens and bird
eggs. In the afternoon
went in town and
examined Bowler's Company
at 4 P. M.

Spent the evening looking
over the bird & egg collection.
The grouse is the best thing
I have in, certainly. I have
yet to examine the
about Washington. Fox
Sparrows, Lutescents
and others.

The books are beautiful
I much like the names
like the "Birds of
California". The writing
is however more
correct and a little
less perfect than
to John Bowler (who
receives practically
no credit for it)

20 Went out in the
late A. M. to take

2. Last egg like for
 the leader. We went
 again to the spawning
 ground and found the
 female but still
 singing. But no nests.
 We paired by the
 night hawk location and
 was much surprised
 to find the female
 at 12 p.m. They
 searched carefully the
 exact spot where nest
 should be for the female
 but could not raise
 her. The male sneaked
 back on the side
 again. He then
 flew near the other
 place. He sang at the
 same place. About 10
 called and it was by the
 way we found
 several old bird's nests
 on the edge of the
 woods. Later we found
 an old sparrow's nest
 with the charge of the
 pitch around the
 hole. Also found an
 old bird's nest, 20 ft
 up. They were located
 at Creeper against an
 oak. The nest

segs well built
but deserted and
contained four added
eggs which can probably
be saved.
We dropped into
a little cove for
lunch and then at
a spring, up the
a couple of miles
upstream. Of course, we
are lost by the way
from the trail. It is a
poorly kept road and
lost in the middle of
the day.

The country passed
there was very pretty
and interesting. Prairie
wood and Birch.
While in a patch of
willow and Oak we
encountered a great
many birds. Great
Chickadees so that I
had a good sport for
comparing. The birds
to summer. They
tasted and were black
and white. The
Chickadees, Oakes
appears red brown; the
white to dirty and

the whole bird
stubby and small.
The Oregon chickadee
note is ~~musically~~
clear - more so
perhaps than the
California bird. The
Chestnut-backed is very
buzzy like a Titmouse.
I heard the Oregon
bird once and then
got him well started
his whistling song.
Several of them got to
singing. Presumably the
same as the same but
with a less perfect
musical interval and
often a flattening and
a rising of pitch, which
seems to be the
general case.
I did not hear the
Chestnut's song.
Perhaps whistling
Chickadees we discovered
an Antelope's note. I
gave the ~~flutten~~ note
and he came a running.
It surely seemed like
it is a green bird
than a yellow.
Soon I started a

Pygmy Owl with
 a pair brought the usual
 flock of small birds.
 Jays, Thrushes, Chipping
 Sparrows, etc. The birds were
 much excited and
 came near. The Pygmies
 are here only in winter
 however.

We left the point
 and struck the east
 line of the highway but
 interesting walk. The
 day had cleared; the
 drift was laid by
 the mountain stood
 out clear and white
 above the green
 incensed fir forest.

Spent the evening
 with Bowles and came
 out to camp late.

After the 29th of
 October I spent some
 Bowles and with a friend
 on day in an collection
 one on Brown's another
 at St. Ignace and
 another picking and
 shipping eggs. It
 had probably be busy

but not too busy for
comfort.

21. Ryck came
up with a "bang".
Then we fooled away
the day in final
physical examinations
and turning in some
equipment. We could
go home camp however.

22. Was R.T. today.
In the afternoon
washed clothes
preparatory to leaving.
Upditch did not go
the last week.
We shall probably
get out tomorrow
noon - a day early!

July 24

I spent the day in cleaning up and generally packing and arranging material to send home. The weather is smoky but otherwise pleasant.

July 25

Went over at noon to Seattle to see J. E. Brown and his skin collection. He works in the Customs office here in town. He is a very pleasant fellow, friendly and rather quiet but capable of saying something of everything when he wants.

We spent a pleasant evening in company with Mr. and Mrs. Brown. They live out near Lake Union, a large body of fresh water connected by canal with the Sound.

Brown's collection is one entirely of the state. It has things pretty well represented and altho he has a lot more to do he is the

skin collector in flesh.
Recently he has had an
exhibit of birds from a
sportsman show there
giving several interesting
new bird species - *Spizella*
socialis and the like.

Bowles also has a
fine extensive representation
of the large *caprimulgus*.
We returned to town
on the 10 o'clock boat.

The gulls on the Sound
now seem to be *caprimulgus*.

evidently from the
interior breeding grounds.
Bowles says the *Glaucidium*
wings don't come in from
the breeding islands.

July 26. Went out to the
point of view, park
outside of town. The
woods were very much
the same as elsewhere
if anything sicker. At
present the summer
slump seems to be on
all bird activity.

I had hoped to see
some of the *Glaucidium*
at the park along the
water front but did not.

Bowles says they nest
all along the strand -
on the *Sphondylia* and
mainland alike. In
certain one place they
nest in burrows in a
clay bank but that the
clay has hardened and
become as rock. The birds
still use the same holes
year after year. The rock
has been hard for some
twenty years that we
know of.

The main attraction
at the park was the
zoo which harbored
several things of interest.
We have in captivity
about a dozen wild geese
from the Arctic. Three
species - the Canada,
Belted and White-fronted.
The geese were in exceptionally
good plumage for summer
and we had a very
close and profitable
study of the birds.

Also there was a
pair of Spectacled Seal
in captivity which
threw some doubt on
Brown's record.

For the purpose of the
present investigation the
data were collected from
the following sources:
1. Direct observation
2. Interviews with
3. Documents
4. Library research

The data were collected
from the following sources:
1. Direct observation
2. Interviews with
3. Documents
4. Library research
5. Other sources

The data were collected
from the following sources:
1. Direct observation
2. Interviews with

4. Library research
5. Other sources

I was interested to
 see a pair of "Spotted-birds"
 brought from Australia.
 I fed them the first I picked
 up a pair from the
 streets and caged them.

Another attraction
 was a pair of very tame
 collared parrots which
 we petted and fed
 dandelion leaves. They
 were most sociable
 and came up along
 the fence to be scratched.
 They were quite clean
 and particularly in
 their manners. They
 really seemed as much
 like pets as the dogs
 with their tiny feet and
 clean habits. For a
 grant they had a low
 decaying squeaking
 chatter which they gave
 continually.

Among other things
 of interest were a pair
 of Alaskan Brown Bears,
~~and~~ a pair of Polar
 bears (in a swimming pool)
 a young cat, Buffalo and
 a very lively Badger. The

Salger certainly did
run like a dog and
did a great deal of
suffering and blowing.

July 27 / Went out to the
nest boxes of the Hooded
Merganser. Boxes for
lack of Merganser Eggs
put of a pair of Hooded
around the little swampy
lake. The first box we
encountered contained a
little screened Owl sitting
in the opening - as boxes
in the same place
it was in in April. I
went up to the nest -
20' up in a maple near
water and the lake -
and found the remains
of the Owl's nest. I was
surprised to find that
the Owl flew - altho
the day was dark and
cloudy.

We went out on the
lake in a boat and
went up to a box where
young Mergansers had
been raised that year.
The box still had some
light colored down

in and around it.
 The box is on a dead
 tree in the middle of
 the lake. While out in the
 boat we saw several
 families of Red-bill Greys
 young half grown. The
 birds both old and young
 were extremely tame
 because of the protection
 they have enjoyed here.
 The Red-bills cut the
 reeds off at
 the base and use them
 for nests much to the
 regret of Dr. Shaver who
 wanted them ~~for his~~
 The birds will cut down
 a large area of the reeds
 to build a nest. The
 result is the nests are
 green and not black
 much as at Buena Vista
 and elsewhere. One nest
 was left with two
 deserted eggs. I would
 not have called it
 a Red-bill nest if I
 had found it and
 not seen the birds.

Dr. Shaver who owns
 the lake reports that he
 shot an Osprey a week

ago and saw a
chink. Muskrats are
common at the lake
altho I saw none. We
also looked over the
place where a Mallard
nested in a tree covered
with ferns.

But what we did see
was several mergansers
and a large flock of
Nighthawks. The mergansers
were of course at a
distance. What I saw
of them was a bird
the size of a teal
but with a very long
snaky looking head and
neck. The crest was kept
upraised while flying &
the birds would fly
about the lake.
The whole all in a dull
greyish plumage and
I don't know have been males,
females, or young. I
don't know. They all appeared
to have a stripe
down the center of the
back due to the
hollow between
the wings and wing
coverts which is unusually

will marked in this
book.

The night hawks were
undoubtedly a group of
singles - (judging by the
white in tail and wing -
which had gathered there
to feed. The day was
cloudy as before mentioned
so accounting for their
presence at mid-day.
They were as thick as
swallows in migration
time (no exaggeration) and
the flock everywhere
about as at flock range.
Certainly I felt the
day was overcast. We
had seen the location
of the "hobbies" principally.
The place was as a
swampy lake in the dense, deep
woods. Everything was
covered and deep. There
were not trees on the lake.
Another interesting
observation was the
chasing of a Red-tail
by several Night hawks.
The Night hawks dove
at the Red-tail but I
could not see them - hit him.

July 28 / During the week we have made two trips to the apartment house, roof where the night hawks nest. Curiously they lay no second sets, at least not in the same vicinity. I wish I could have been in town when Bowles took the first set, as I wanted to see how the birds acted.

Our hopes were gone the last two nights because the bird was calling and flying low over the building, however it was not booming.

In the afternoon, Mr. Grant of Cleveland who has been on a 4 months trip to the interior of Alaska visited Bowles and his collection.

His stories are like an Ologist's dream. He has money, ambition and luck. He keeps only personally taken sets. He had a village of 200

natives blowing eggs
and spotting nests.
He collected 57 species
of Alaska birds 27 of
which were shore birds.
Red-backed sandpiper
Pac. Gold Plover. (probably)
sandpiper were some of
the common takes. In
10 days he collected some
2000 eggs and blew them.
Also he found five
new nests previously
unknown to science.
He showed us his notebook
with list of species
and set marks. Needless
to say the afternoon
was interesting. He was
much pleased with
Bowers collection.

July 29 / Got ready leave
and at upon took
the boat for Seattle,
leaving many good
memories and several
good friends.
As we left Seattle
on the big boat I could
not help but feel the
grandeur of the country.
The deep sound purring

back into the pine
clad country with
the great rocky woods
abundant birds perched
all about. Tacoma.

The boat passed thru
part of the Straits of
Juan de Fuca at
Tacoma and I watched
the lights on the
Olympic mountains
as we sailed along.
I only wish I could
have seen the country
all the way to Cape
Hatteras.

July
30.

The ocean was
unusually calm
and the sky clear.
I spent a good deal
of time watching for
birds but saw few.
However I did see
my first petrel flying
about over the waves
like a black tern.
I couldn't tell what
species it was but I
suppose the Laysan
or Booby Petrel. Later
I saw some birds that
looked like shearwaters

but they were far off.
 At 6 o'clock I saw
 an Albatross at least
 as near as I can figure
 out. It was flying in
 the wake of the boat
 but well back. I could
 see nothing but the
 white and dark color
 of the bird. I am quite
 sure that at this time
 we were opposite Crescent
 City California.

July 30 As I think of
 the birds of the Puget
 Sound region they
 seem to be purely coast
 forms of California birds
 with a sprinkling of
 Eastern species creeping in
 from the north across
 the transition belt. In
 Alaska the Eastern
 species come across the
 coast and so it is
 reasonable some should
 come down to Washington.
 Also there is a suggestion
 of Branta form in
 the Gulls and for Sparrows.
 East of the mountains

is a mixture of prairie
birds and southern
California birds.
Gophers and Baltimore
Chicks with the Sage
Brush association ~~it~~
is East of the mountains
is even more of a
meeting place of Eastern,
Coast, California and
Prairie birds. I should
certainly like to study
the paper as there
would probably be
more new things there
than around Puget
Sound.

However for my
purpose the Puget Sound
has been instructive as
it is my first experience
of the transition of the
humid coast belt.

(So I sum up things
by thinking out loud. It
may well be that I want
to remember my questioning)
Arrived in San Francisco
early this morning and
met Dad. Spent the
day at the Academy
of Science and the Univ.

in Berkeley. The boat
left again at five P.M.
and we go down by
Monterey by dusk. The
wind was blowing
hard thru the gate but
the sea was calm.
outside, I saw quite
a flock of some sort
of scots about sundown.
They flew ahead of the
boat and then came
rapidly.

Aug

Rock Wren

April 16 1924 / 7, incl.

Burster fossil / ribs near

a long crack (horizontal) in
the cliff, rather narrow, but
ran back $1\frac{1}{2}$ ' to a pocket in the
earth where eggs were located.
Could not get hand thru
crack - Call by Holmes. Nest hole
body whitewashed. Birds did
not come around and were not
sitting but flew from the
crack on two previous visits.

Winkley, Mojave Desert,
Calif. Nest in a cañon in bad-land
country. Located on a hill-
side (near the bottom of
a small wash. Nest
placed in a small hole
in the soft ground. Nest
material could be seen
from the wash. Nesting
cavity small; hole at entrance
also small. Bird flushed
on approach. Nest poor made
of grass chiefly. No rocks in
nest as was found. To be the
case in two nests containing
young.

Desert Sparrow Hawk
April 17, 1954 / 4
Barstow fossil beds - near
Winkley, San Bernardino Co, Calif.
In a big canyon of cinchona wood
on the N.W. side of canyon on a west
exposure. Nest hole on perpendicular cliff
in an overhang, 14' up. Nest

Palmyra

March 20, 1901

Spent the day on the
island collecting and in
the afternoon went to the
beach.

The morning was very
hot, although it
was dry. The weather was
pleasant. All of the birds
that I saw were very
friendly. I heard many
songs of sparrows, and
breeding. I saw several
breeding also. Cactus Wren
nest found with four
eggs. Two sets of nests
found and one other
nest. Heard one bird
singing. Costa Hummer
building nest and
many singing.

~~March 21, 1901~~
Cactus Wren taken

Mar 26 1923

Kangaroo Rat -

Humped in to a ditch that had been just filled evidently following its old trail. It was very much surprised and turned and swam back.

— Verdin - first verdin nest with eggs found 3 probable not complete. Bird sat tight. Bit at finger when put in the nest.

— Costa Hummer many pairs mating and building only one nest found with eggs by law

White Rumped Shrike Set of 5 eggs taken (secondary birds spot, 11M)

— Dead Poor Will picked up by store.

Wind came up and has blown off and on all day

No Crisal Thrashers
or Alberts Towhees seen
as yet. or Long Sandpiper

Only hawk seen here
was I saw (accepting) probably
cooper.

Only two mockers
seen this year

Picidae

N. Willow Woodpecker

Date May 8 1923

Set. N. 14 $\frac{3}{5}$

Ap. No. 394 e

Local. Arroyo Seco Cal.

Sp. commenced incubo just started

Coll. by Alden & Milly

Nest in stub 5 ft. up mastasum.

Rem. There were three birds attending the nest apparently two females and one male. When the male bird would call the bird sitting presumably a female flew away to him meanwhile another pure female would come and partly enter and inspect the hole and would be vigorously as the other bird. When the two other birds returned there would be a ground fight and chase thru the trees all birds mixing up. Then one would return to the nest and yet then a somewhat somewhat similar process would reoccur later on. On taking the set after the birds had deserted either from the hole cut in two days before the dissection of the community quarrel it was found that two eggs were of a large type while three were

of a smaller rounded type.
This looks to be polygamy.
